                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ORGANISM
                                                                                                                                                                                                                                source
                                                                                                                                                                                                                                          Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).

                                                                                                                                         was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hint end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreeis. Vector DNA was prepared from a derivative of pWD42 (gi | 4732114 | gb | AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          musculus (house mouse)
                                                   Conservative
                                                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWH2 (gi |4732114 |gb|AF129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BB8D03.fwd, genomic survey sequence.
that are associated with repression of an integrated human immunodeficiency virus type 1 (HIV-1) promoter. HIV-1 integrated not results in the formation of an integrated human immunodeficiency virus type 1 (HIV-1) promoter. HIV-1 integration results in the formation of precise and homogeneous junctions between viral and hose DNA, but integration takes place at many locations. Thus, the variation in HIV-1 gene expression at different integration sites reports the activity of regulatory sequences at nearby chromosomal positions. Negative regulation of HIV transcription is of particular interest because of its association with maintaining HIV in a latent state in cells from infected patients. To identify chromosomal regulators of HIV transcription, we infected Jurkat T cells with an HIV-based vector transducing green fluorescent protein (GFP) and separated cells into populations containing well-expressed (GFP-positive) or poorly expressed (GFP-negative) proviruses. We then determined the chromosomal locations of the two classes by sequencing 971 junctions between viral and cellular DNA. Possible effects of endogenous cellular transcription were characterized by transcriptional profiling. Low-level GFP expression correlated with integration in (1) gene deserts, (11) centromeric heterochromatin, and (111) very highly expressed cellular genes. These data provide a genome-wide picture of chromosomal features that repress transcription and suggest models for transcriptional latency in cells from HIV-infected patients."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR with specific primers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Conservative
                                                             Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnaxes/). The DNA (http://www.jax.org/resources/documents/dnaxes/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptore ONA, and transformed into

                                                                                                                                                                                                                                                                                                                                                        (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pW142 (gi |4732114 |gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              USA

Intel://www.jax.org/resources/documents/dnares/). The DNA
musculius C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.05 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
10.5 kb range using preparative agaro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Laboratory Mouse DNA Resources (documents/dnares/). The DNA (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNPA2 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                 Odnservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwp42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /clone_lib="Mouse_10kb_plasmid_UUGC1M_library"

The invention relates to 4 novel types of ammonia-oxidising bacteria (AOB) found in freshwater aquaria. The bacteria are able to oxidise ammonia to nitrite and are members of the ammonia-oxidising bacteria family of the beta subdivision of Proteobacteria. The 4 types of bacterican de distinguished on the basis of their 16S rRNA (ribosomal RNA) gene

bacteria

New bacteria capable of oxidizing ammonia to nitrite, for preventing or alleviating the accumulation of ammonia in fresh water aquaria, seawater aquaria and waste water.

WPI; 2002-075367/10.

The invention also encompasses isolated 16S rRNA gene sequences of the amounia-oxidising bacteria of the invention, oligonucleotide probes and primers for the detection of these bacteria, and compositions comprising the bacteria. The bacteria of the invention are useful in biological filters for reducing ammonia accumulation in both freshwater and seawater aquaria. They may also be used in waste water treatment and in bioremediation processes to reduce the level of pollution caused by ammonia. The present sequence represents a specifically claimed probe for the detection of the 16S rRNA gene sequences of the type A and A1 ammonia-oxidising bacteria (ABA02416-ABA02417). (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           19-SEP-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising an isolated bacterial strain that ammonia to nitrite, useful for alleviating or preventing the of ammonia in aqueous environment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO2004026772-AE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nitrosospira sp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nitrosospira-like 16S rDNA probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADM32708;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 18 BP; 2 A; 9 C; 2 G; 5 T; 0 U; 0 Other;
                                                              This sequence represents a probe which was used in the detection of 16S TDNA sequence derived from an ammonia oxidising bacteria (AOB). The amplified sequence may be used in a composition which comprises an isolated bacterial strain that oxidizes ammonia to nitrite. The composition may be used for alleviating or preventing the accumulation of ammonia in a medium. The ammonia is reduced by at least 30% when compared with a level of ammonia that would exist in the absence of the bacterial strain. The composition is useful for alleviating or preventing the accumulation of ammonia in aqueous environment, e.g. a freshwater or

                     The invention relates to an oligonucleotide which includes at least 1 nucleic acid sequence which binds to at least 1 nuclear protein found in lung cells (e.g. the thyroid transcription factor 1, TTF-1, protein). The oligonucleotide can be expressed in lung cells via a vector and can be used to target therapeutic agents to kill lung or thyroid cancer cells. The oligonucleotide can be used to detect or diagnose lung or thyroid cancer. The oligonucleotides may be designed from the sequences of, for example, the promoters of lung-specific genes such as those encoding surfactant proteins. The present sequence is a mutated oligonucleotide from human surfactant protein B, SPB, promoter used in an EMSA (electrophoretic mobility shift assay) assay to confirm the presence of TTF-1 binding sites in the SPB promoter. The TTF-1 site has been mutated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 18
                                                                                                                                                                                                                                Oligonucleotide sequences which bind nuclear proteins and surfactants found in lung cells, useful for detecting cancers that originate in the

The amplified sequence may be used in a composition which comprises an isolated bacterial strain that oxidizes ammonia to nitrite. The composition may be used for alleviating or preventing the accumulation of ammonia in a medium. The ammonia is reduced by at least 30% when compared with a level of ammonia that would exist in the absence of the bacterial strain. The composition is useful for alleviating or preventing the accumulation of ammonia in aqueous environment, e.g. a freshwater or

The XT enzyme occurs in at least two isoforms (XT-I) and (XT-II). XT is involved in the biosynthesis of glycosaminoglycans. XT polypeptides and polynucleotides may be used in the production of an agent (inhibitors and antagonists of XT) for the treatment of sclerotic diseases and chronic inflammatory joint diseases, or as a diagnostic marker. The XT DNA may be used a gene marker. Anti-XT antibodies are used as a diagnostic tool in a immunological assay for detection of a protein having XT activity

cc activity, a protein having cell cycle modulatory activity, a protein associated with DNA repair or damage, a nuclear targeting protein, and a cc progesterone receptor protein or its portion, where the portion of the cc second polypeptide is sufficient to bind to the EDD polypeptide or the cc complex; (7) a method for determining a predisposition for disease, or cc disease state; (8) a method for determining a modulator of the activity, formation; (10) a method for determining a modulator of the activity, cc arid, ribozyme, peptide nucleic acid, (12) a pharmaceutical compatition acidl; (11) an antisense nucleic caid, ribozyme, pNA, interfering RNA or sirNA. EDD has cytostatic acid; and be used in gene therapy. The method and modulator are useful for creating a condition associated with sreast cancer, melanous cell carcinoma, hepatocellular carcinoma, ovarian cancer, cc lung cancer, gastrointestinal cancer (e.g. sguamous cell cancer, bladder cancer, prostate cancer, non-squamous carcinoma, plioblastoma and medullablatorom. The composition are useful to reducing the expression of EDD in a cell to inhibit cellular proliferation. The present sequence represents a PCR primer for human carbonic anhydrase II, which is used in the cc exemplification of the present invention.
                                                                                                                                                    닭

A protein of the invention has herbicide activity. The proteins and their encoded genes are useful e.g. in constructing new breeds of herbicide-resistant plants and also in developing various breeds of herbicide-resistant plants and also in developing various agrechemicals. The present sequence is used in the exemplification of the

Specifically, this antibody is directed towards the MN gene, a cellular oncogene known alternatively as carbonic anhydrase 9, CA9 or MN/CA9, which encodes the MN protein that is also known as the MN/CA IX isoenzyme, carbonic anhydrase IX. CA IX or the MN/G250 protein. The present invention describes the generation of this monoclonal antibody, and immunoreactive fragments thereof, which are directed against non-immunodominant epitopes on the CA IX extracellular domain. As such, this antibody can be useful diagnostically as a marker for preneoplastic/ neoplastic tumours, immunodetection methods and immunotargeting approaches. Accordingly, compositions exhibit cytostatic activity and are useful in the diagnosis, prognosis and treatment of various cancers including breast, bladder or lung cancer, in tumour therapy and in antitumour vaccination. This oligonucleotide sequence is an PCR primer used

The invention may be useful for the development of compounds with a cytostatic activity or a vaccine whilst the disclosed sequences may be used for gene therapy. The protein and method are useful for screening, diagnosing or prognosing diseases associated with abnormal expression of carbonic anhydrase IX protein, such as precancerous and cancerous diseases like renal cell carcinoma, breast cancer or colorectal cancer. The monoclonal antibody may also be used for treating or preventing precancerous and cancerous diseases. The present sequence is that of a PCR primer which was used in the exemplification of the invention.

     맑
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway
                                                                                                                                                                                                                                                                                                                                                            21-MAR-2001;

gene

product.

This invention describes a novel method for identifying gene products compounds inhibiting proliferation of an organism act. The method comprises obtaining a culture of strains overexpressing a different product for proliferation of the organism, contacting the culture with compound to inhibit proliferation of strains that do not overexpress the

The invention relates to a novel DNA encoding a weed controller metabolism protein. A protein of the invention has herbicide activity. The proteins and their encoded genes are useful e.g. in constructing new breeds of herbicide-resistant plants and also in developing various agrochemicals. The present sequence is used in the exemplification of the

New isolated DNA molecule encoding a monocyte-macrophage cell surface apoB48 receptor protein (apoB48R), useful in preparing a composition treating e.g., familial or non-familial hypercholesterolemia. for

Example 23; SEQ ID NO 17; 77pp; English.

The invention describes a new isolated DNA molecule, encoding a monocyte-macrophage cell surface apo848 receptor protein (apo848R) comprising a fully defined 1088 amino acid sequence. The DNA molecule is useful in preparing a composition for treating Pattern B phenotype, familial combined hyperlipidaemia, familial or non-familial hypercholesterolaemia, hypertriglyceridaemia or low plasma high-density lipoprotein levels. This sequence represents a primer used in the isolation of human monocytemacrophage cell surface apo848 receptor DNA.

A cc delivery of therapeutic compounds to human moncytes, macrophages or cother reticuloendothelial cells that express the receptor, a method of cinhibiting foam cell formation and increased monocyte adhesion to cendothelial cells and a method of evaluating an individual at risk of a cardiovascular disease. The monocyte-macrophage cell surface apoB48 creceptor protein is useful in the apoB-mediated cellular uptake of plasma cc hylomicrons and remnants and hypertriglyceridaemic triglyceride-rich cc lipoproteins in an ApoB independent pathway, a lipoprotein lipase cc independent pathway or a heparin sulfate proteoglycan independent cc pathway. It is also useful for the cell-specific delivery of therapeutic compounds to human monocytes, macrophages or other reticuloendothelial cells that express the receptor, for inhibiting foam cell formation and conceased monocyte adhesion to endothelial cells and for evaluating an individual at risk of a cardiovascular disease such as compounded to human monocytes achieved as a popular disease such as compounded to human monocytes achieved achieved as a popular disease such as compounded to human monocytes achieved achieved as a popular disease such as compounded to human monocytes achieved achieved achieved as cardiovascular disease such as compounded to human monocytes achieved achieved achieved achieved as cardiovascular disease such as compounded to human monocytes achieved a The invention relates to the human monocyte-macrophage cell surface apolipoprotein B 48 receptor (apoB48R) protein and the nucleic acid encoding it. The invention also relates to a method of cell-specific

                                                                                                                               The invention relates to a composition that contains, as active agent, an ccid, polypeptide or antisense nucleic acid, polypeptide or antisense nucleic acid, antibody against EG-VEGF or cits receptor (EG-VEGFR), or EG-VEGFR antisense nucleic acid, is useful cor the treatment or prevention of endometrial diseases. Also included cor are a method for detecting uterine receptivity (by determining the amount cor feg-VEGF polypeptide and/or nucleic acid, using the new composition) or a test system for identifying antagonists of EG-VEGF-R. Also disclosed as new is a splice variant of the human GPR73a receptor. It contains an additional exon which includes a stop codon, so produces a truncated cor protein that can not mediate signal transduction, i.e. it functions as a composition that can not mediate signal transduction, i.e. it functions as a composition that can not mediate signal transduction, i.e. it functions as a composition that can not mediate signal transduction, i.e. it functions as a composition of edges to the composition of the composition of the best time for composition of eggs fertilised in vitro. Also the test system that composition is used to screen for composition and the express the EG-VEGF receptor is used to screen for composition of edges fertilised in vitro. Also the test system that composition is used to screen for composition and the isolation of the EG-VEGF cDNA.

Sequence 470164, Application US/10719956

Publication No. US20040146910A1

GENERAL INFORMATION:
APPLICANT: Xue Mei Zhou
TITLE OF INVENTION: Methods of Genetic Analysis of Rat
FILE REFERENCE: 3527.1

CURRENT APPLICATION NUMBER: US/10/719,956

CURRENT FILING DATE: 2003-11-20
PRIOR APPLICATION NUMBER: 60/427,836
PRIOR APPLICATION NUMBER: 60/427,836
PRIOR FILING DATE: 2002-11 20
NUMBER OF SEQ ID NOS: 699466

SOFTWARE: Microarray Probe Sequence Listing Generator V 1.1
